JUNCTIONX TURKU 2026 · CHALLENGE: IF INSURANCE COULD DO MORE

If Life Partner

An app that helps people take care of their home before something goes wrong, and gives them a reason to stay with If while they do it.

58	14	0–1000
risks in the catalogue, built from If's own home insurance terms	types of vetted partner who can fix them	one care score, four tiers, real rewards

The moment

Owning an older home is a life event that many people meet without a guide. They buy a house, plan to sell it, or read an inspection report that says "*much to repair*" (paljon korjattavaa). The report is long and written for experts. The owner does not know what matters, whom to call, or what waiting will cost.

Insurance is often visible only after the damage. A fire from an old fuse box or a water damage from old pipes is the moment the customer meets If. We want If to be there **before**.

The idea

The customer uploads a home inspection report. The app turns it into a short list of risks, each with a reason in plain words, a benefit, and a quote from the customer's own report. The customer books an If-vetted partner. The partner confirms the fix. The care score rises and unlocks rewards.

1	2	3	4	5	6
Upload	**Read**	**See**	**Book**	**Confirm**	**Reward**
The customer uploads an inspection report (kuntotarkastus).	A model reads the facts. Code, not the model, decides the risks.	A short list: up to 5 risks, most serious first, with proof from the report.	One tap to book an If-vetted partner. Price range and discount are visible.	The partner confirms the work. Only outside proof counts.	The score rises. Tiers give discounts, offers and a lower deductible.

The demo in one line

A 68-year-old owner of a 1975 house in Turku uploads a report that says "much to repair". The app shows 5 risks. The owner books an electrician for the old screw-fuse panel. The electrician confirms. The score goes from **486 to 546** and unlocks **Silver**: 5% off the next job and offers on If products.

Team: Antton (system design, backend, model pipeline), Ege (app design), Rasi (risk analysis and service design). All partners, prices and score numbers in the demo are mock data. The mechanism is real.

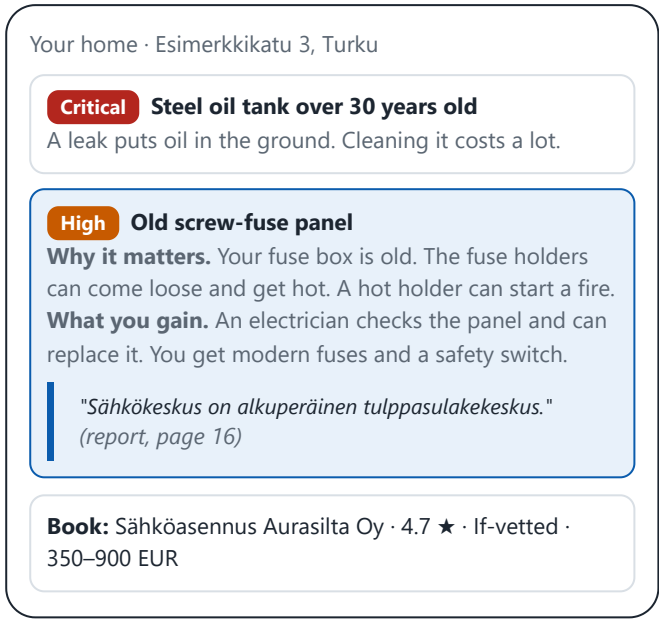

Criterion 1

Customer value and relevance

The need is real and easy to state: "Tell me what to fix first, who can do it, and what I gain." An owner of an older house should not need to read a long technical report or search for a contractor.

What the customer gets

- **A short list.** Up to 5 risks. The app ranks them by severity × probability, so the most serious come first.
- **A reason in plain words.** Each risk says why it matters and what the customer gains. No expert terms.
- **Proof.** Each risk shows the sentence from the customer's own report, with the page number.
- **Partners that If has vetted.** Rating, price range, If-vetted badge and the customer's discount on one card.
- **A reward ladder.** Four tiers: Bronze, Silver, Gold, Platinum.
- **A maintenance list.** Each check has a due date and a state: overdue, due soon or scheduled.
- **Family help.** A relative can act for the customer, with the customer's permission.

The screen is a sketch of one risk. The real app is designed in Lovable.

Built for the average Finn, including older people

A native app, simple screens, plain words. Finnish, Swedish and English. The customer never has to learn insurance terms.

The value is easy to see

BEFORE	WITH IF LIFE PARTNER
A long report in Finnish technical language. Many findings. No order.	5 risks in order. Each with a reason, a benefit and a quote.
The owner searches for a contractor and cannot compare.	Vetted partners on one card, with price range and discount.
The owner does not know if the work was done well.	The partner confirms. The owner and the family see the record.
No reason to keep going after one repair.	A score, tiers, rewards and a maintenance list bring the owner back.

What the customer protects

Their safety, because fire, oil leaks and water damage are the risks that matter most. Their money, because a fix costs less than the damage. Their insurance position, because the If terms ask for repaired electrical faults and approved installers, and cut payments by the age of old electrical equipment. A new panel restarts that age.

Criterion 2

Business value for If

Every mechanism below is built into the service. None depends on the customer making a claim.

WHAT IF GAINS	HOW THE SERVICE DELIVERS IT
Fewer claims	Each confirmed fix removes a cause of damage. The risk list covers the protection rules and the excluded events in If's own home insurance terms (OMA 200.27). A fire from an old fuse box or a water damage from old pipes is a claim that does not happen.
Verified risk data	A partner's confirmation turns a guess into a verified fact about the home. Underwriters see the real state of the house, with its source: report, partner or customer.
Faster, better claims	When a claim comes, the maintenance history and the proof of work are ready. Claims handlers see what was done and when.
Retention	Seasonal reminders, the maintenance list and the score progress bring the customer back. If appears in a positive moment, every year, not only after a loss.
Acquisition	The report upload and offers at Silver reach people who are not If customers yet. They arrive with verified data and a low risk profile.
New income	Partners pay to be listed and fund the customer's discount in return for volume. That reward costs If nothing.
Customer insight	If staff see which risks customers have and which products fit them. Sales and product teams get a real signal.

What the rewards cost If

REWARD	WHO PAYS
Partner discount (5%, 10%, 15%)	The partner
Lower deductible (Gold 100 EUR, Platinum 200 EUR)	If, only when a claim happens
Offers on If products	Nothing up front
Better premium	Never automatic. If decides case by case.

The score and the tiers

Bronze
0 – 499

Silver
500+ · 5% off, offers

Gold
750+ · 10% off, −100 EUR

Platinum
850+ · 15% off, −200 EUR

Only outside proof moves the score. A customer's answers alone cannot take them past Bronze (about 450). False information sets the benefit score to 0. Old fixes fade, so the customer keeps up the care.

Why this is credible

- If already runs a related programme, Kunnon Koti: a partner inspects detached houses every four years. It gives a one-off report with no effect on the premium. If Life Partner makes this continuous, scored and rewarded.
- Press coverage of If's own inspections reports that about one in five houses has no subsoil drains, or nobody knows if they exist (Taloustaito). That is a risk If can see and reduce.
- The mechanism does not need new insurance products. It works on top of the existing home insurance and its terms.

Criterion 3

Feasibility and scalability

The backend is built and the app is in design. The design rule keeps it safe to scale: **code decides, models read and write.**

How it works in practice

- **Input:** a standard Finnish inspection report (kuntotarkastus, KH 90-00394). The format is the same across inspectors, so one reader works for all.
- **A model extracts the facts:** year, heating, panel, pipes, roof. Every fact keeps its source, a quote and a confidence.
- **Code matches the facts to a risk catalogue.** The catalogue holds severity, probability, points, partner type and re-check interval. A model cannot change them. It may only choose catalogue ids.
- **A model writes the customer text** from catalogue hints. A person can review every text.
- **Code picks the partners** and builds the maintenance list.

The model runs on local hardware. This keeps customer documents private and keeps the cost low.

What is built now

PART	STATE
Backend, jobs and risk list	Code in place
Reading synthetic reports	Code in place
Risk catalogue	20 in code, 58 designed
App design	In design
Partner confirmation	Mock
Partner network and prices	Mock
Score numbers, tiers, rewards	Mock
Strong e-ID, ownership check	Not built

How it scales

- **More risks, no new engine.** A risk is one catalogue entry. The 38 new risks we designed from If's terms need new entries and a few new house facts, not new code.
- **More possessions.** A car or a life event, for example a marriage or a new child, is a new catalogue and a new score. The care score combines them.
- **More partners.** A partner joins by vetting and listing. We defined 14 partner types and the proof each one gives.
- **More data.** Public data, for example the building register and weather alerts, feeds the maintenance list.
- **More languages.** The catalogue text is plain and short, so it translates well into Finnish and Swedish.

What must happen before launch

GAP	PLAN
Severity, probability and points are expert estimates	Calibrate against If claim data.
Partner vetting and confirmation	Onboard a first set of partners. Add a secure confirmation step.
Ownership and identity	Strong electronic identification and delegated access for family helpers.
Premium and deductible rules	Check Finnish insurance rules. Keep price decisions with If.
Data sharing	Share only what a booked job needs, and only with consent.

Criterion 4

Innovation and experience

Most insurance apps show policies and claims. If Life Partner does not. **Insurance is not the centre of the experience. The customer's home is.**

From claim time to care time

The service meets the customer when they take responsibility for an ageing home. It helps with the work itself: what to fix, who does it, what it gives back. If becomes a partner in the home, not a bill and a claim form.

Proof, not promises

The care score moves only when an outside source confirms a fix: a partner, an inspector or a document. The customer cannot fake it. That makes the score useful to If and trustworthy to the customer.

Insurance terms as a to-do list

The home insurance terms hold protection rules: sweep the chimney, test smoke alarms, close the main valve after a week away. Few customers read them. We turn each rule into a risk and a task, so the terms protect the customer in practice.

Every risk traces to the customer's own document

The app shows the quote and the page. The customer sees that the risk is not invented. Facts show their source, and unknown facts are marked as unknown.

The experience

- **Short and calm.** Five risks, not fifty. Plain words, no alarm.
- **Gamified with real rewards.** A score from 0 to 1000, four metal tiers, and a bar that shows the next reward.
- **A reason to return.** Seasonal reminders, a maintenance list, and a score that fades without upkeep.
- **Family-ready.** A relative can follow and act, so the oldest customers are not left out.

Silver starts at 500. The demo fix moves the customer from Bronze to Silver.

Versus other options

	GENERIC INSURANCE APP	KUNNON KOTI TODAY	IF LIFE PARTNER
When	At purchase and at a claim	Every 4 years	Continuous
What the customer gets	Policy and claim forms	A report	A ranked risk list, partners, reminders
Proof of care	None	One report	Confirmed fixes with dates
Reward	None	None on the premium	Score, tiers, discounts, offers

Next steps

Phase 1 (now): a working house service. Phase 2: full functionality, partner network, and a view for If staff. Phase 3: Finnish and Swedish, then the car and life events such as marriage or a new child.

Honest scope: the partners, prices, score numbers, tiers and discounts are mock data for the demo. The risk catalogue values are first estimates and need calibration with If claim data. The mechanism is real: read the customer's document, match it to a catalogue, reward outside-confirmed fixes. The backend code for it is in place.
